

the fork with the original. To accomplish this, the upstream (original) repository must first be declared in **Git Shell**.

**Right-click the repository in GitHub Desktop** and choose **Open in Git Shell**:

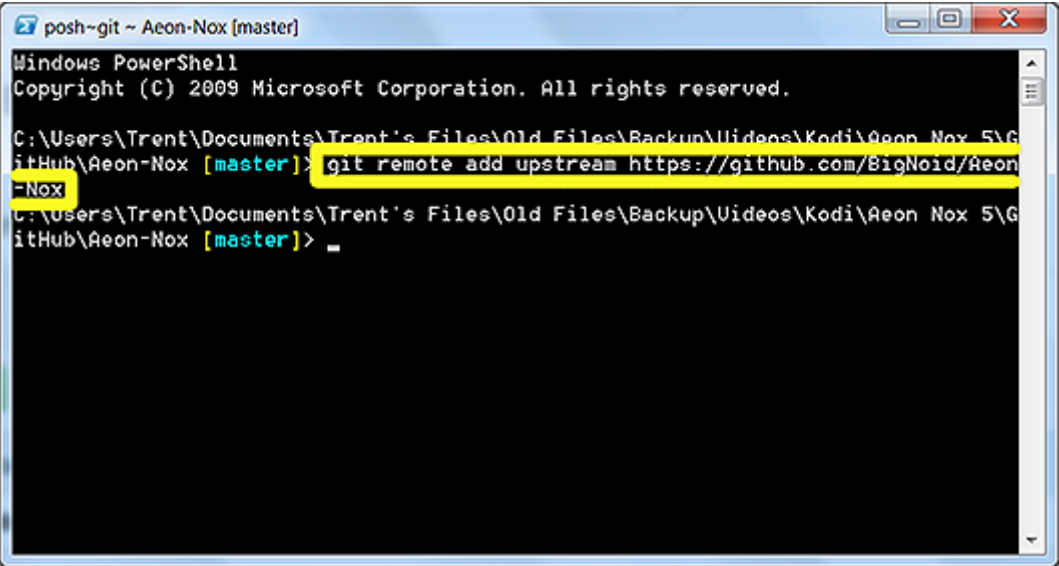

**Git Shell command prompt:**

**Step 1 – Add Upstream Repository**

In this example, the upstream repository is **Aeon Nox 5** (<https://github.com/BigNoid/Aeon-Nox>).

Type: **git remote add upstream** <https://github.com/BigNoid/Aeon-Nox> (<https://github.com/BigNoid/Aeon-Nox>)

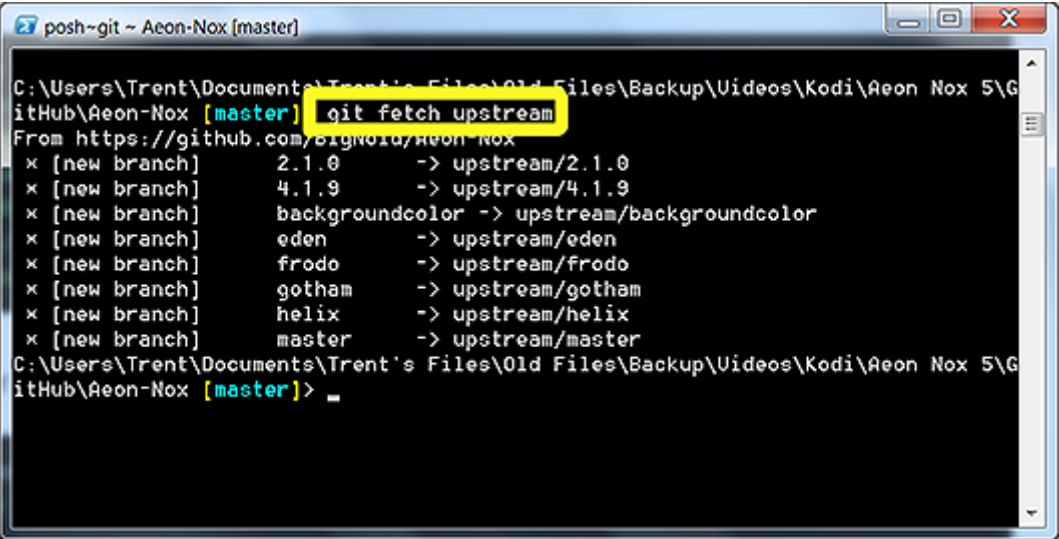

The upstream repository is added.

**Step 2 – Fetch Upstream Branches**

To load remote branches before syncing, it is necessary to fetch this information from the remote server.

Type: **git fetch upstream**

Changes from all remote branches are loaded.

**Step 3 – Sync Changes with the Forked Repository**

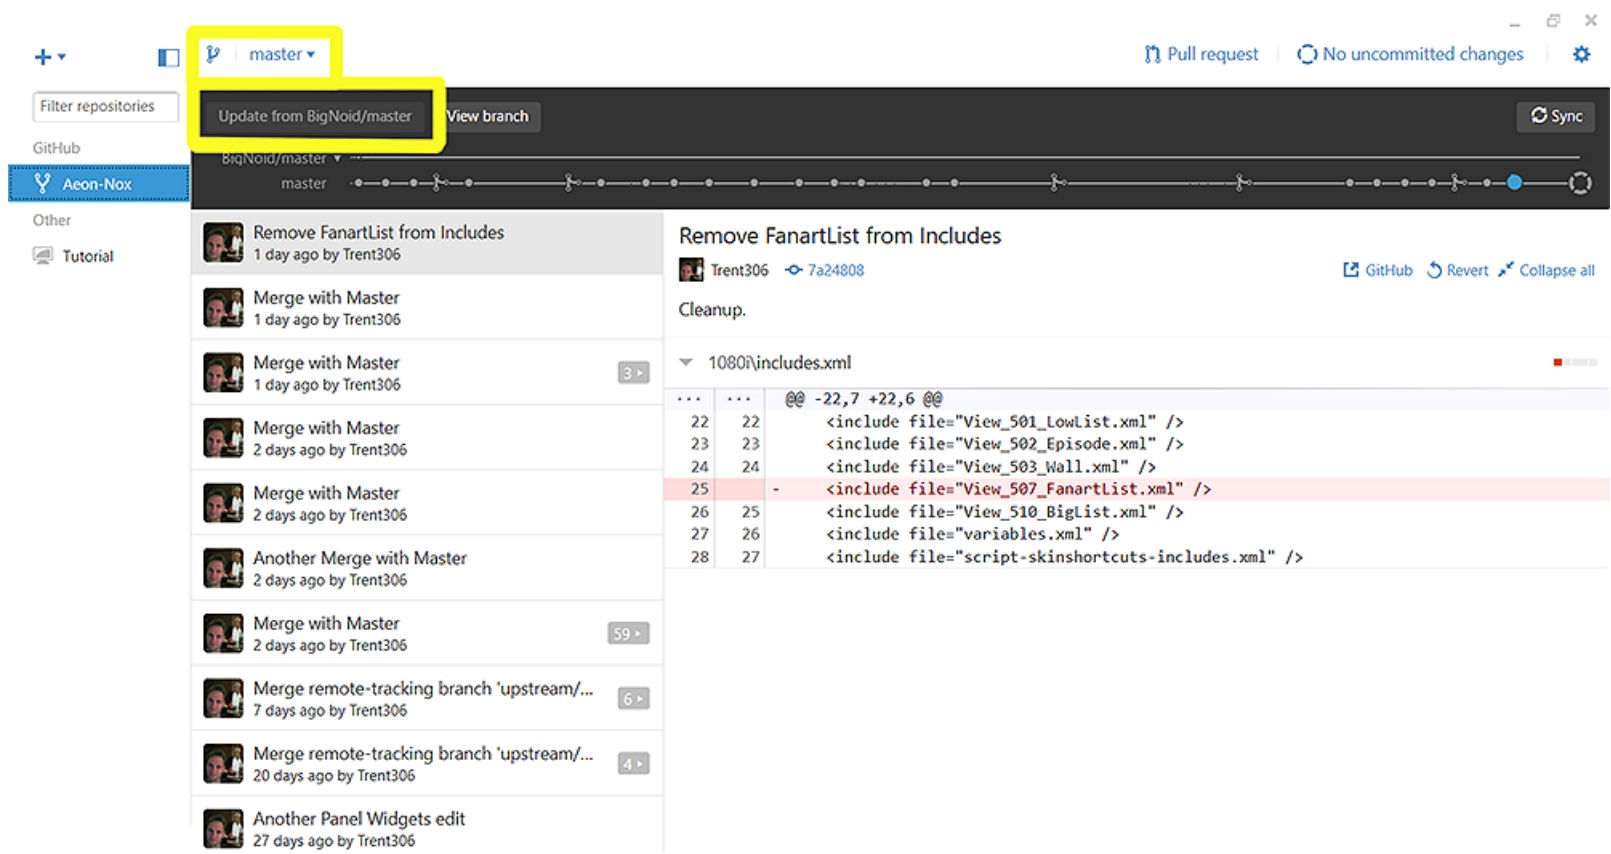

Close **Git Shell** and return to **GitHub Desktop**. You should now be presented with an option to update the current branch with the selected remote branch. Be careful when updating from this screen by ensuring the correct paths are chosen. The example below shows two choices are required before updating:

*Top:* Choose Local Branch (e.g. *master*)

*Black:* Choose Remote Branch (e.g. *ORIGINAL/master*)

After selecting the desired branches, click **Update** to download files from the remote server.

Changes from the original repository are synced to the fork. In this case, synced changes come from the **master branch**.

Opening **GitHub Desktop** will show the new commits on the fork's timeline. Local files in the GitHub folder are updated. **Sync** all local changes to the server.

#### Alternative – Update with Git Shell

It is possible to manually apply updates using **Git Shell** with the commands below:

##### **git fetch upstream**

Changes from the upstream (forked repository) are loaded.

##### **git merge upstream/branch**

The local branch is synced to the desired remote branch. For example, *git merge upstream/master* would download changes from the remote master branch.

## **6. DEALING WITH MERGE CONFLICTS**

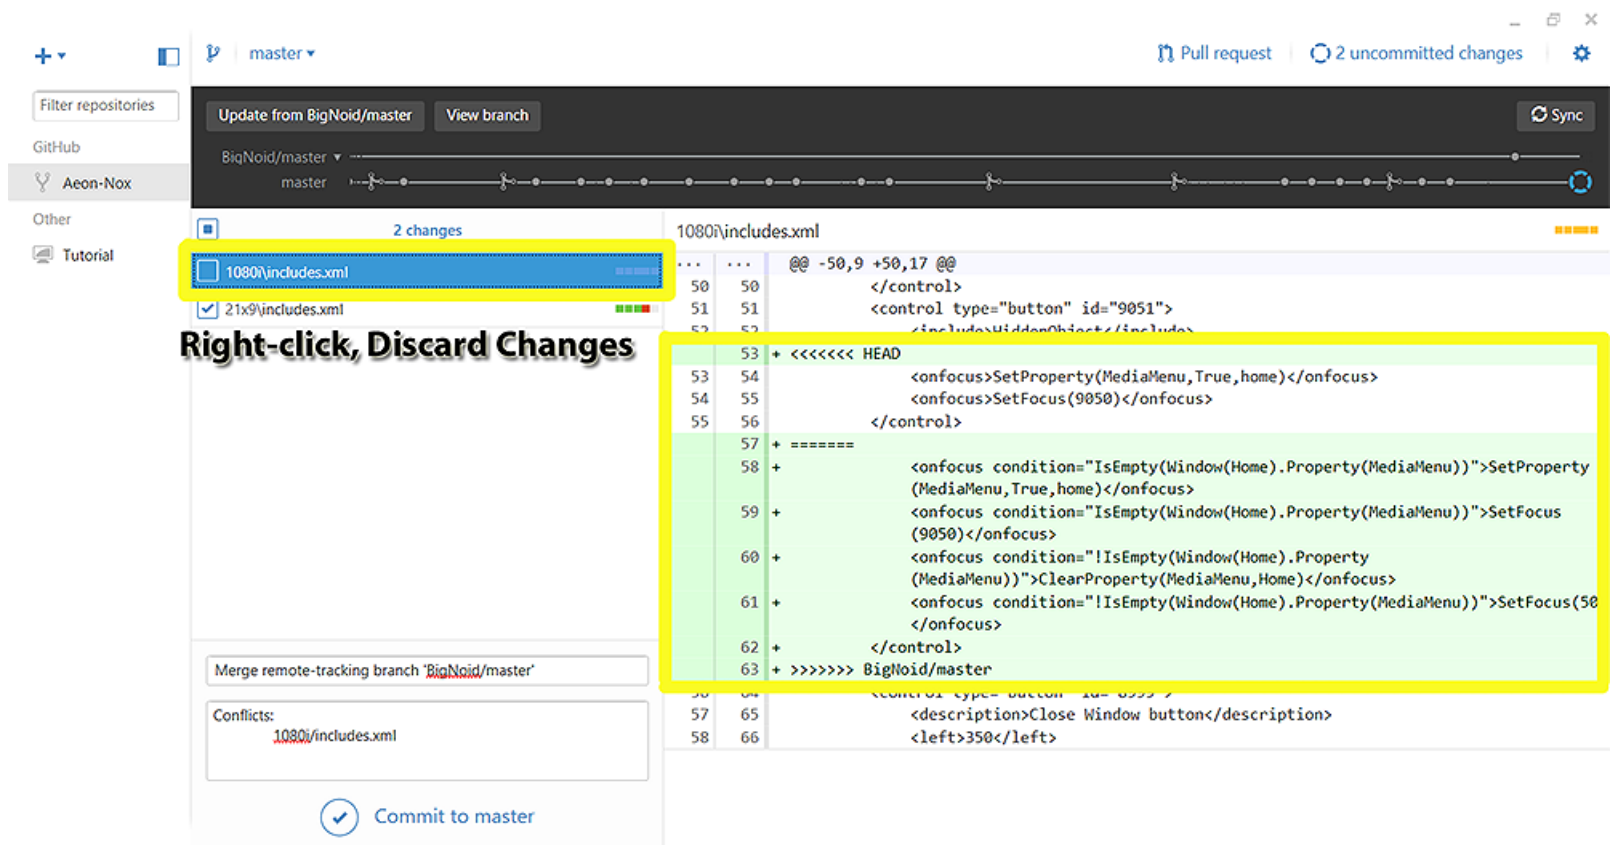

Merge conflicts may arise during merges with the original repository if common code is in conflict. These files can be ignored or edited manually at the discretion of the user. The more one edits a fork, the more likely merge conflicts will arise. If you are merely syncing with an online repository and not editing any files on your own, then merge conflicts will be unlikely.

#### Discarding Changes to Conflicting Files

In this example, conflicting files will be discarded to allow the sync to be completed. A commit should be loaded after attempting a sync with the remote branch. This is an extra commit on top of those downloaded from the main branch, which provides a summary of all files involved including those in conflict.

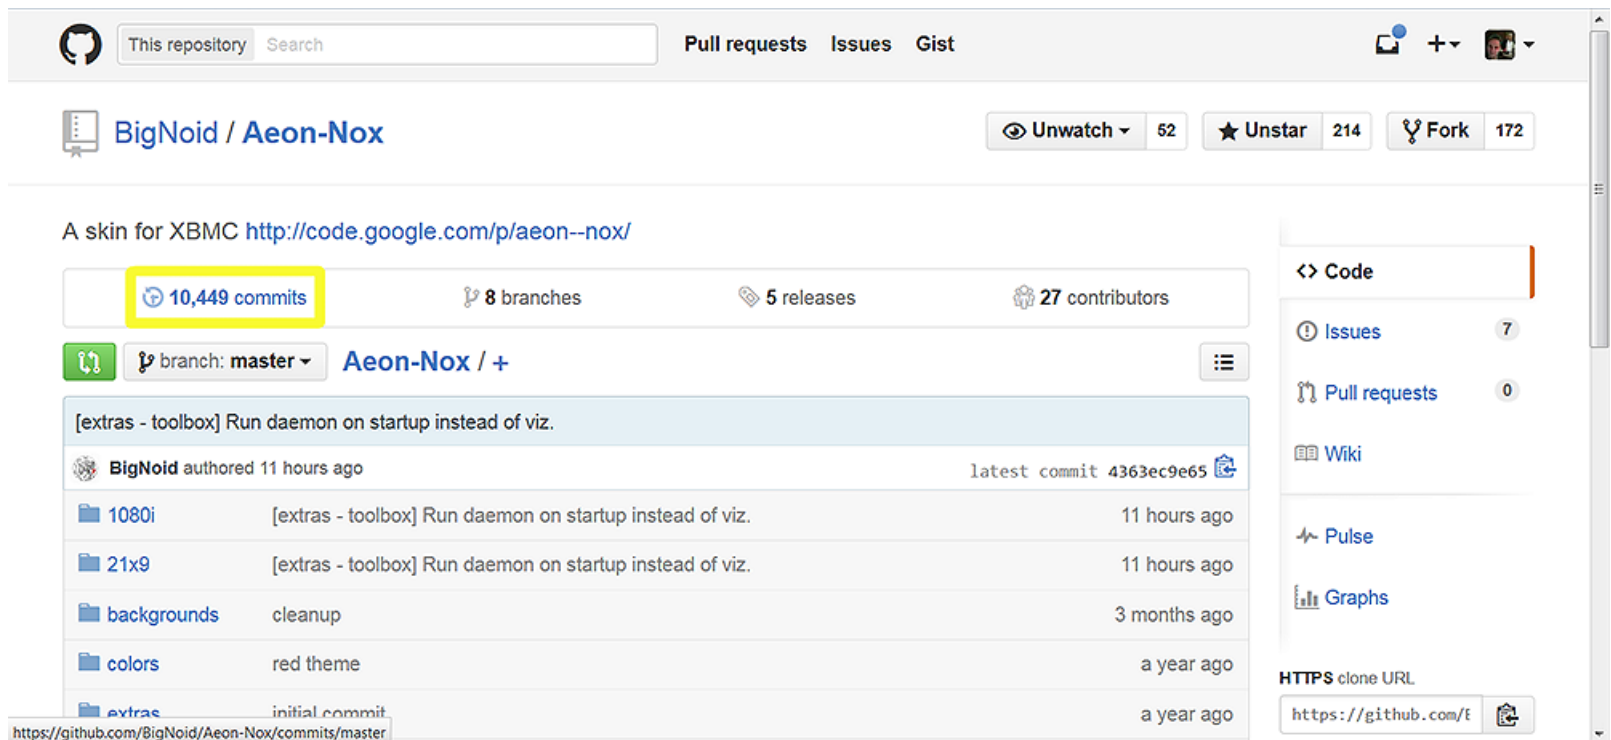

**Any file not checked by default is in conflict.** The code on the right clearly indicates where code conflicts are apparent. Any commit attempted with these conflicts will be rejected.

The recommendation is to **right-click each conflict** and select **Discard Changes**. These commits will be dealt with manually:

#### Add Changes Marked as Conflicts as Manual Edits

Open the original repository and click the commit button in the top-left corner:

A list of commits will be loaded. Choose the commit with the conflicting file and open the same file in Notepad++ or another xml editor. Add each desired change to the xml. This can mean hunting down line numbers and cutting and pasting text. It may be easiest to download the file from the original repository and paste the changes from downloaded file:

Showing 2 changed files with 8 additions and 4 deletions.

Nice! Small comment; instead of

Code:

git merge upstream/master

do

Code:

git rebase upstream/master

to avoid merge commits.

7. CREATING A NEW BRANCH

- Choose the existing branch from which the new branch will be based.
  - e.g. master
- Click on the Y-shaped **branch icon** in the top-left corner. Type the desired name of the new branch and select **Create new branch**.
  - e.g. isengard

- Click **Publish** to publish and sync the new branch to the server.

- Future updates to this branch would be made as follows:
  - Select the branch to sync locally in **GitHub Desktop** (e.g. **isengard**). This will change the composition of the files in the GitHub folder;
  - Insert local files into the **GitHub folder** and create a new commit.

OR

- Select the local branch to be synced in **GitHub Desktop** (e.g. **isengard**);
- Select the remote branch to download changes in **GitHub Desktop** (e.g. **BigNoid/isengard**);
- Click **Update** to merge with the desired branch.

**Sync** all local changes to the server.

Note: All synchronization is dependent upon the active branch selected in GitHub Desktop. Changing branches changes the content of the files in the GitHub folder. So only one branch can be active and edited at any time.

8. USING TORTOISEGIT FOR EASY SYNCING

If a detailed summary of each commit is unnecessary and you are simply wanting to remain synced with an online repository without forking it, **tortoisegit** may be what you are after.

**Install:**

- [git for Windows \(https://git-for-windows.github.io/\)](https://git-for-windows.github.io/)
- [tortoisegit \(https://tortoisegit.org/\)](https://tortoisegit.org/)

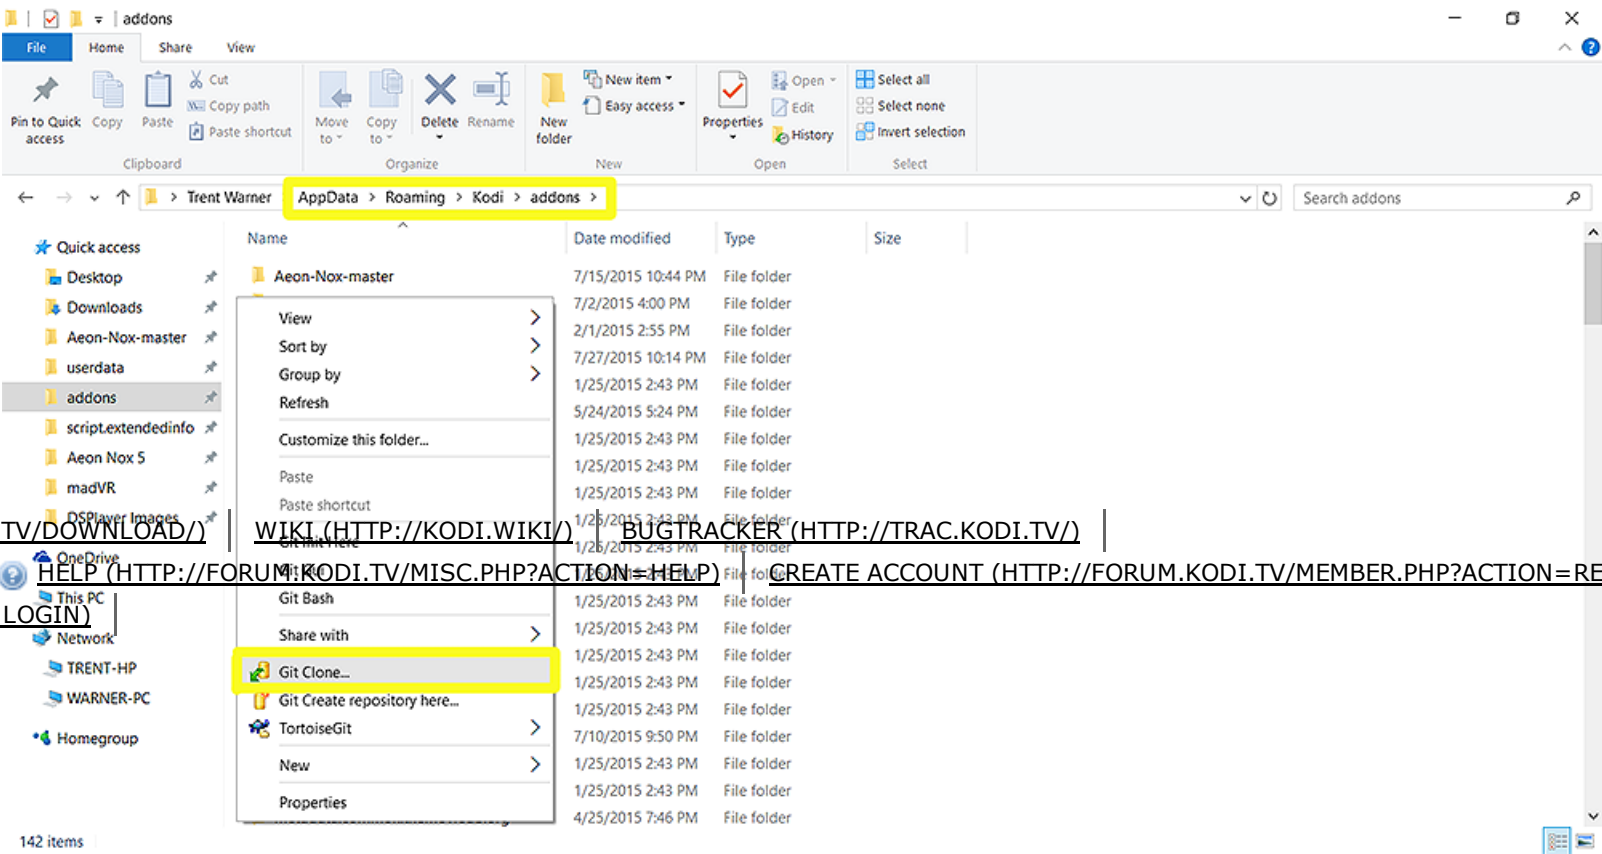

**1. Clone the Repository**

The cloned repository should be placed in the **Kodi addons** folder with all other active Kodi addons.  
**e.g. C:\Users\USERNAME\AppData\Roaming\Kodi\addons**

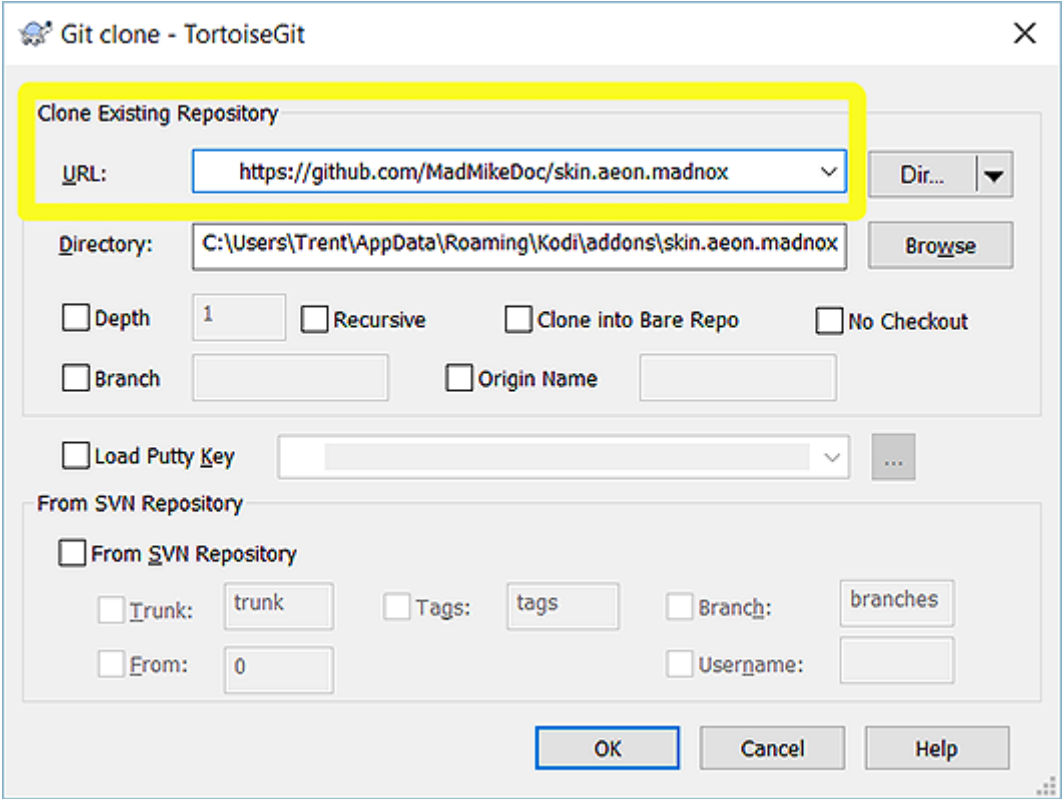

**Right-click** on an empty space in the addons folder and select **Git Clone...**

[BLOG \(HTTP://KODI.TV/\)](http://kodi.tv/) | [DOWNLOAD \(HTTP://KODI.TV/DOWNLOAD/\)](http://kodi.tv/download/) | [WIKI \(HTTP://KODI.WIKI/\)](http://kodi.wiki/) | [BUGTRACKER \(HTTP://TRAC.KODI.TV/\)](http://trac.kodi.tv/) | [SEARCH \(HTTP://FORUM.KODI.TV/SEARCH.PHP\)](http://forum.kodi.tv/search.php) | [HELP \(HTTP://FORUM.KODI.TV/MISC.PHP?ACTION=HELP\)](http://forum.kodi.tv/misc.php?action=help) | [CREATE ACCOUNT \(HTTP://FORUM.KODI.TV/MEMBER.PHP?ACTION=REGISTER\)](http://forum.kodi.tv/member.php?action=register) | [LOGIN \(HTTP://FORUM.KODI.TV/MEMBER.PHP?ACTION=LOGIN\)](http://forum.kodi.tv/member.php?action=login)

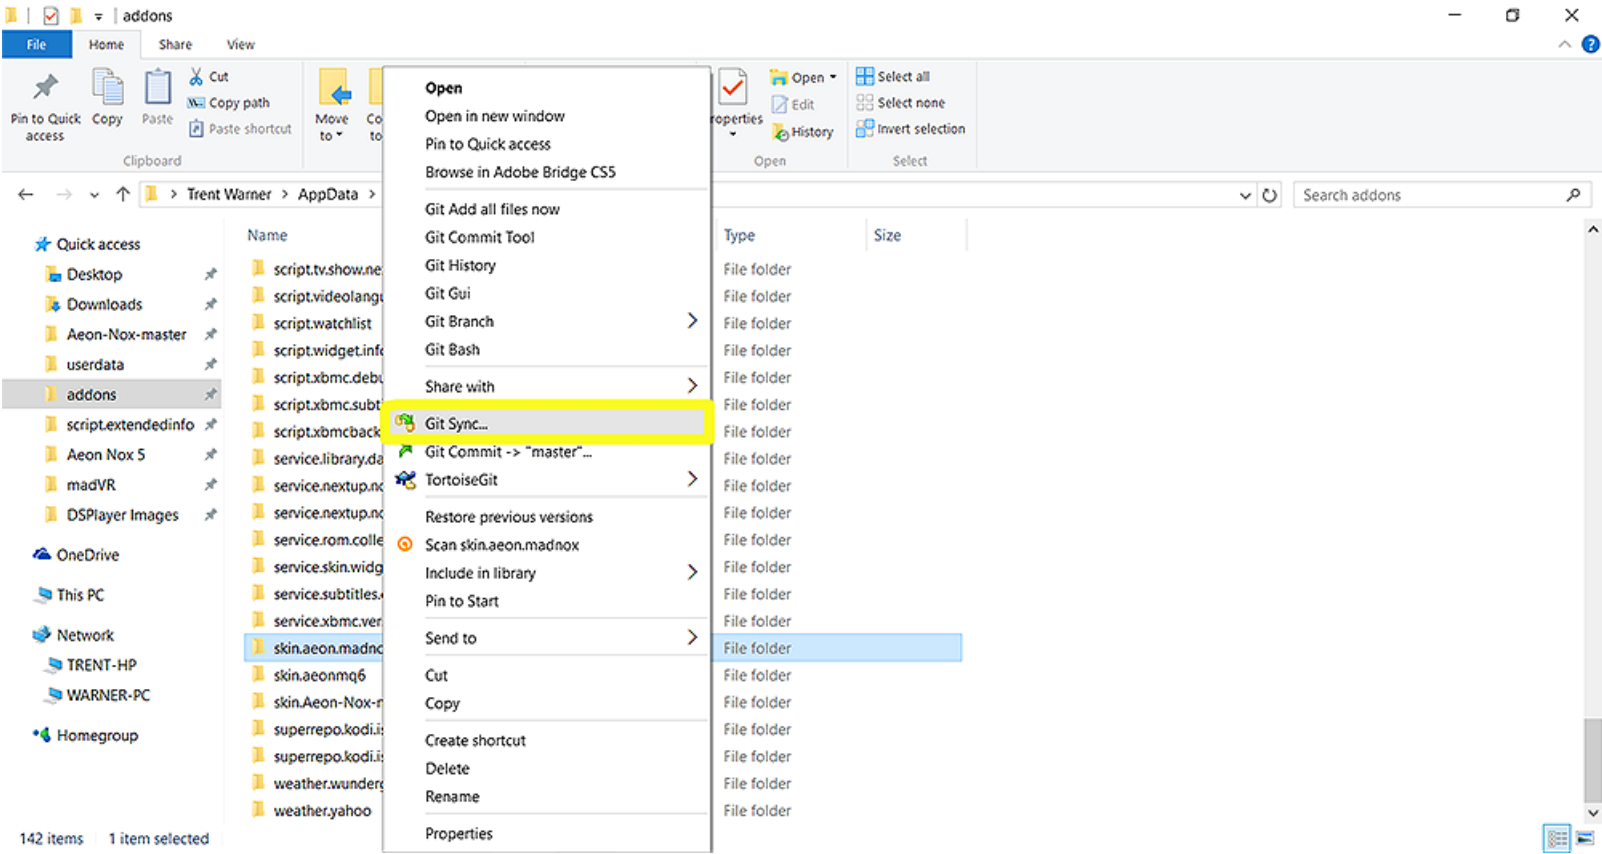

Enter the **URL of the repository** in the top address bar:

The repository will be cloned to the addons folder. This may take some time depending on the size of the repository.

**2. Sync the Downloaded Repository with the Original**

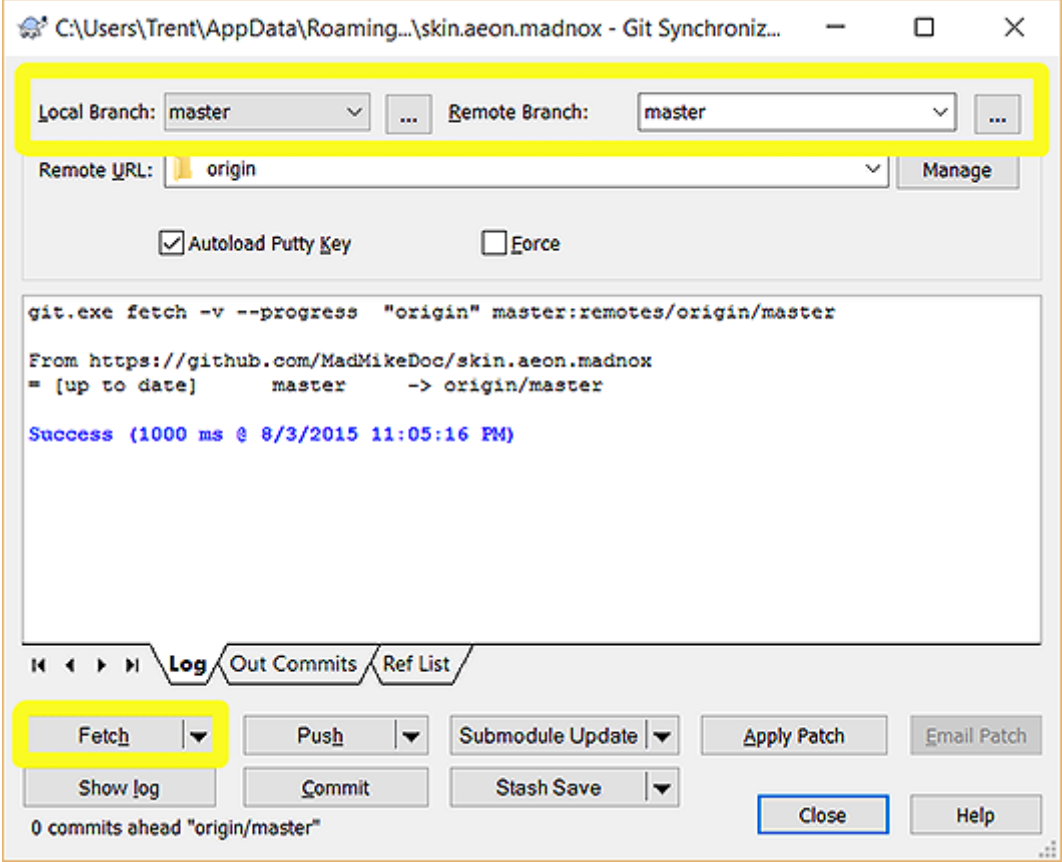

**Right-click** on the folder of the cloned repository and select **Git Sync...**

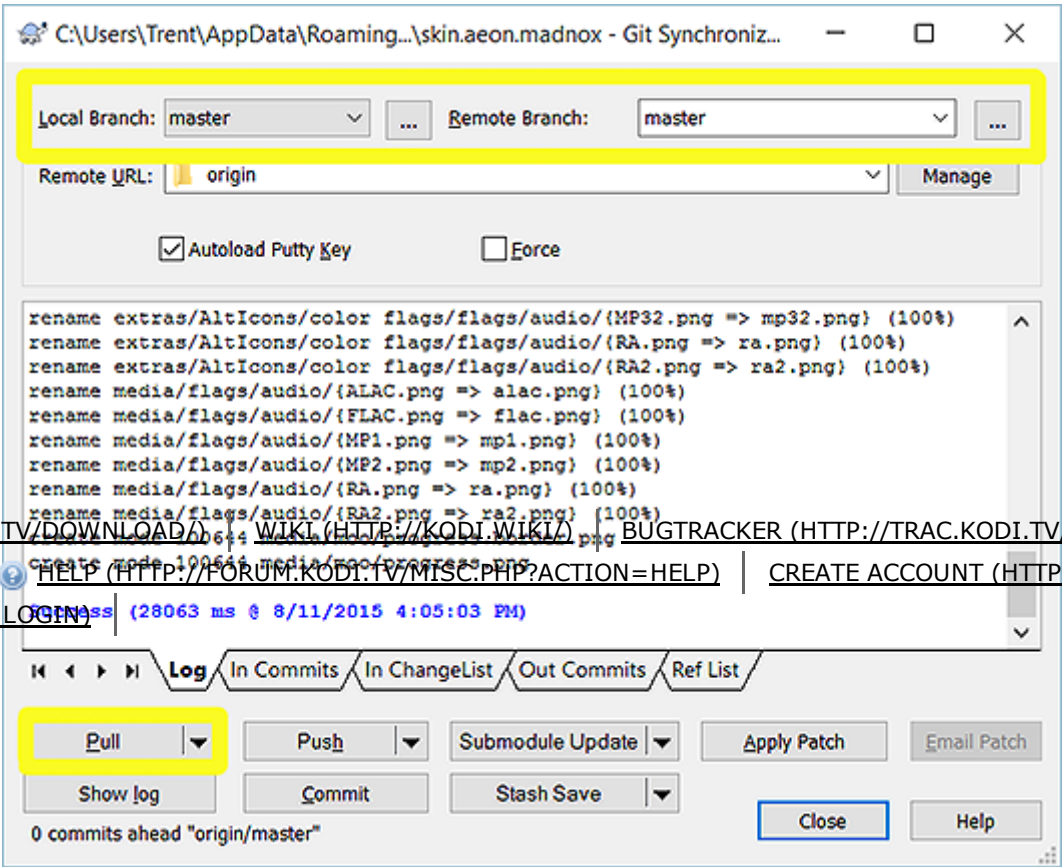

A menu will pop-up. From here, it is possible to select what **Local Branch** will be updated from the chosen **Remote Branch** of the original repository.

Two commands are of use:

**Fetch:** Loads a list of the most recent commits from the selected **Remote Branch**.

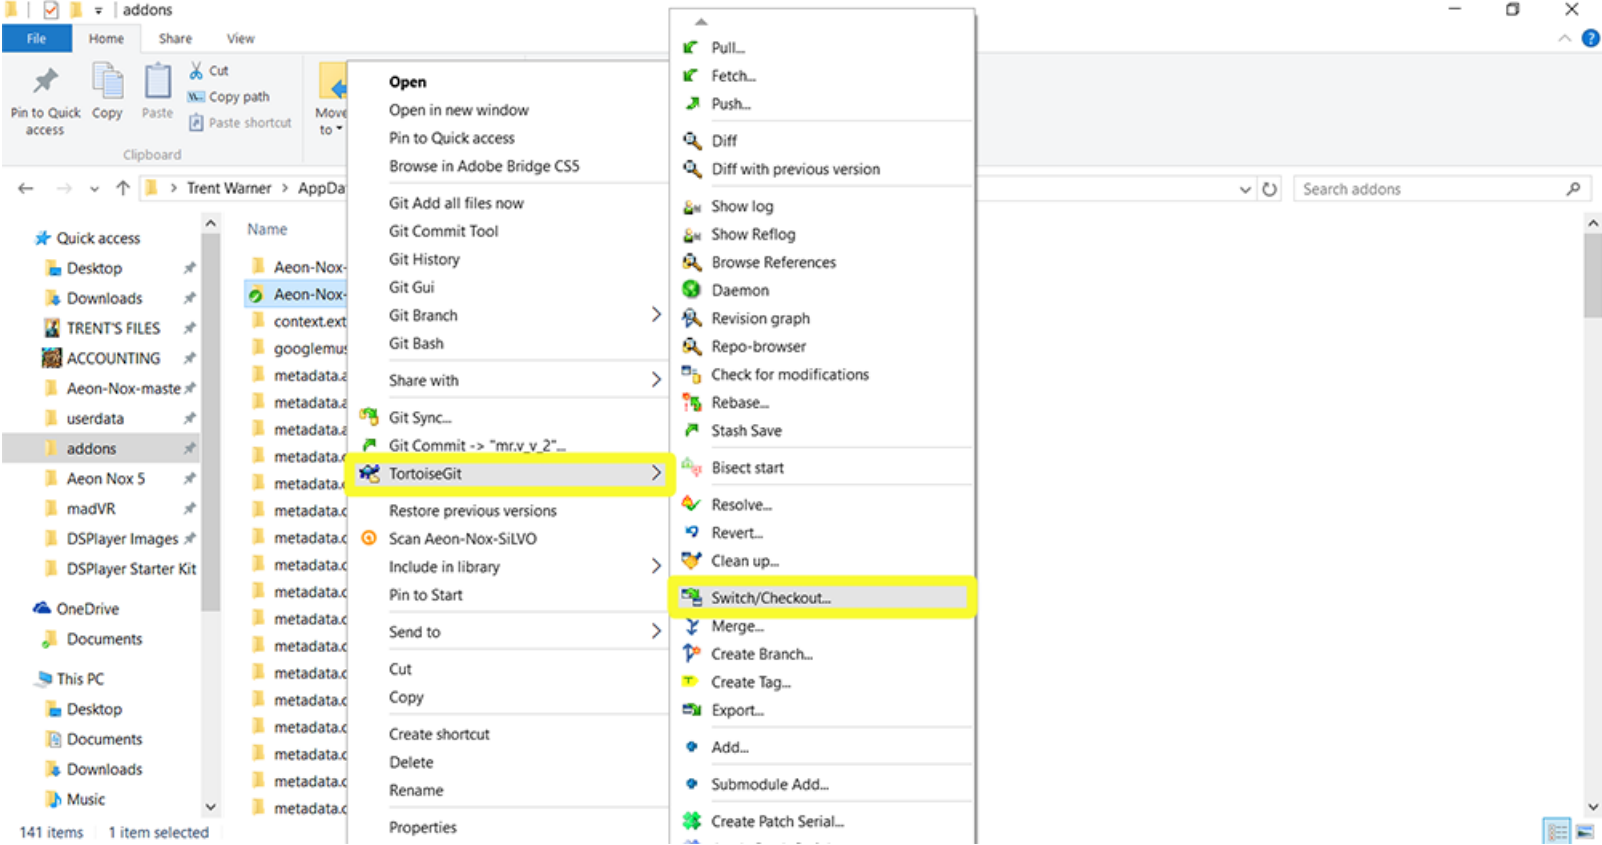

**Pull:** Completes a local sync of all changed files from the selected **Remote Branch**.

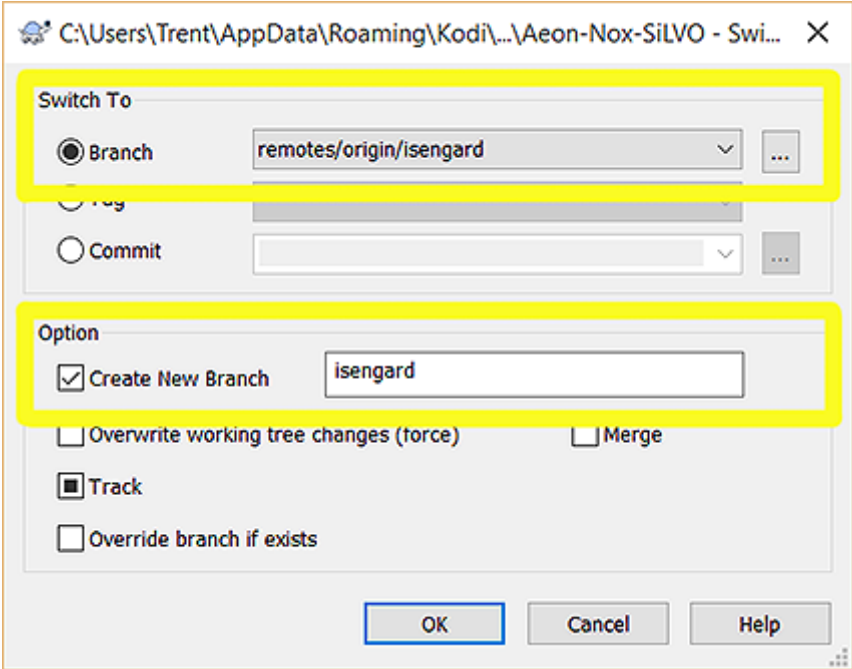

3. Change & Add New Branches

Git Clone downloads the **master** branch by default. To switch to additional branches, **Right-click** on the folder of the cloned repository and select **TortoiseGit -> Switch/Checkout...**

Choose the branch and leave the checkbox **Create New Branch** ticked. The contents of the folder in Kodi addons will be changed to reflect the new branch.

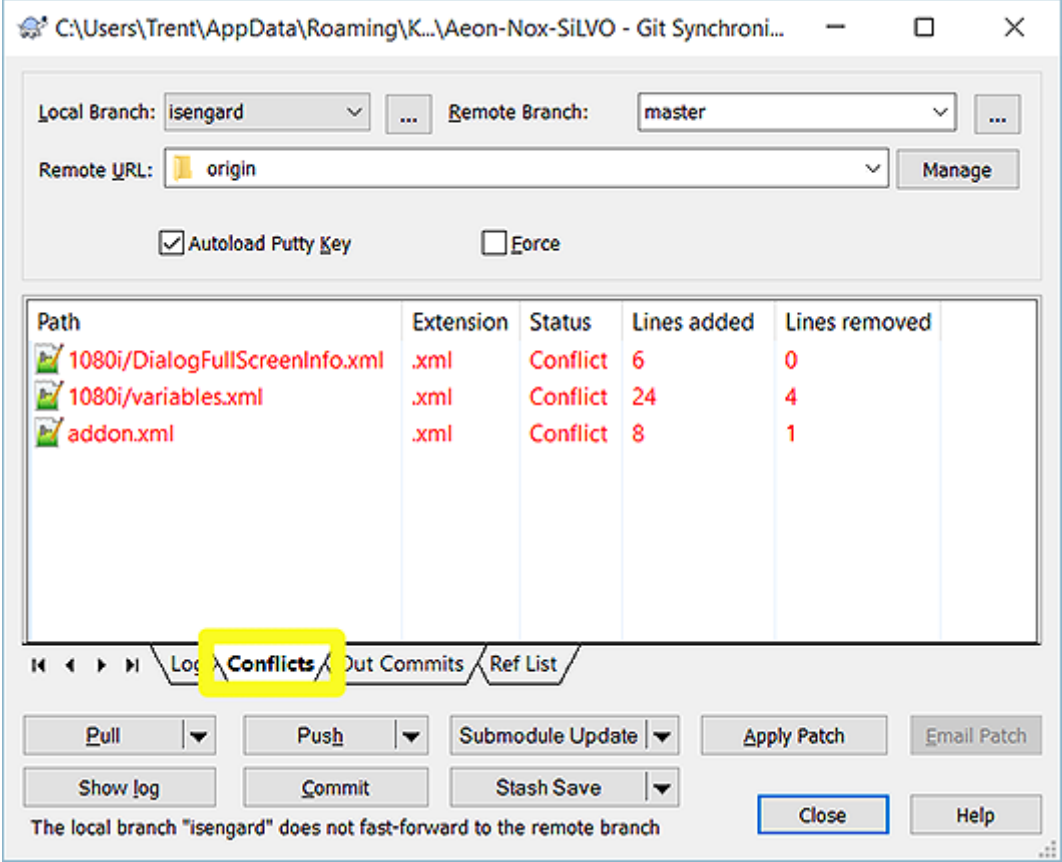

Switching between branches is possible with the context menu.

4. Resolving Merge Conflicts

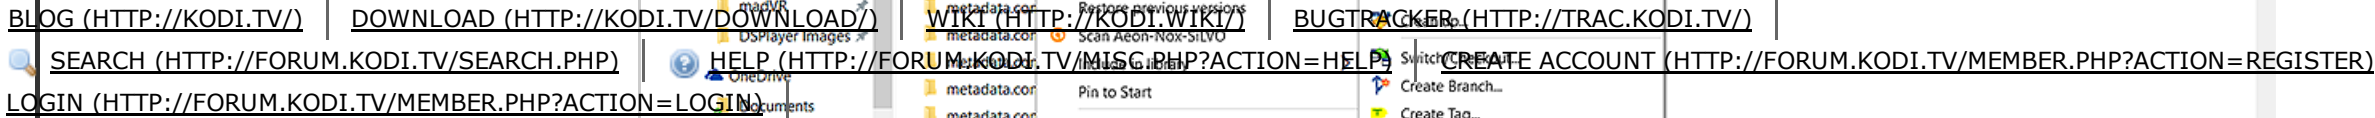

During the process of switching branches and merging, it is possible to encounter merge conflicts where tortoisegit is unable to merge changed files due to code conflicts. These exceptions must be dealt with separately. If not, **Git Sync...** will be unavailable until conflicts are resolved.

After the **Pull** request, problem files will be highlighted in red in the **Conflicts** tab. These files have common code incapable of being updated because the line numbers of each document are in conflict:

To correct this, **Right-click** on the folder of the cloned repository and select **TortoiseGit -> Resolve...**

When all files are edited/replaced, **Select all** and choose **Ok**.

C:\Users\Trent\AppData\Roaming\...\Aeon-Nox-SiLVO...

[isengard 1bf52f4] Merge branch 'master' of https://github.com/mikesilvo164/Aeon-Nox-SiLVO into isengard

Success (594 ms @ 8/11/2015 10:31:47 PM)

Push... Close Abort

If the merge was completed successfully, the folder should **display a green checkmark**. This indicates **Git Sync...** is available once again:

Name	Date modified	Type	Size
 Aeon-Nox-master	7/15/2015 10:44 PM	File folder	
 Aeon-Nox-SiLVO	8/11/2015 10:24 PM	File folder	
 context.extendedinfo.dialog	7/2/2015 4:00 PM	File folder	
 googlemusic-xbmc-develop	2/1/2015 2:55 PM	File folder	
 metadata.album.universal	8/9/2015 5:07 PM	File folder

I returned to `git merge upstream/master` because `git rebase upstream/master` was giving me a detached head error -- not syncing to the correct branch.

**git rebase --abort** was required to cancel this error.

**git commit --amend** is also useful for undoing the last commit.

**git merge --abort** can be used to abort a merge in-progress.

all I want to do is automatically update the MADNOX skin with new updates.  
 I am not a computer expert.  
 I tried your instructions by installing GIT and tortoise in section 8 above but when I right click on empty space I do not see GIT Clone.

I get GIT commit Master and Tortoise.  
 I dunno how to paste images here.  
 please any help will be appreciated.

Did you install Git for Windows?

Try opening Tortoisegit from Program Files and attempt to clone from there.

Try opening Tortoisegit from Program Files and attempt to clone from there.

Thanks for the response...

yes GIT for windows...  
in program files many exe's for tortoise ... none for clone... really lost here.

just a thought when installing GIT what options should I have used? maybe some of my choices could have been the wrong ones.

Regards,  
PJ
